

Troubleshooting

Issues

Not Streaming

Possible Reasons

1. The input stream may be misconfigured or might have been stopped.
2. The transcoder may be misconfigured or not be running properly.
3. The packager may be misconfigured or may not be running properly.

Debugging Steps

1. Check if the input stream has the correct Content ID from CMS. (Content ID is case sensitive)
2. Check Input Stream with ffprobe on respective server
3. Test playing input stream with VLC Player
4. Check if transcoder status is "Running"
 - a. If not running then restart the transcoder
5. Check if packager status is "Running"
 - a. If not running then restart the packager
6. Try restarting the transcoder and respective packager. (Disable and Enable resource to restart)
7. Test playing AES Playlist URL with VLC
8. Escalate if still not fixed.

(If it need to be escalate please provide all the above updates)

Mosaic

Possible Reasons

1. Incorrect VLAN tagging or multicast routing.
2. Source encoder is not sending a stable stream.
3. The transcoder may not be running properly.
4. The packager may not be running properly.

Debugging Steps

1. Check Input Stream with ffprobe on respective server
2. Try restarting the transcoder and respective packager

3. Escalate if still not fixed

(If it need to be escalate please provide all the above updates)

Buffering

Possible Reasons

1. The transcoder may not be running properly.
2. The packager may not be running properly.
3. chunks are not getting downloaded in expected time.

Debugging Steps

1. Try playing with the browser and check network logs. See if chunks are getting downloaded in expected time.
 - a. If chunks are not downloading within expected time, diagnose the network.
 - b. If chunks are downloaded in time and still buffering
 - i. Try restarting the transcoder and respective packagers(Disable and Enable resource to restart)
 - ii. Escalate if not resolved.

(If it need to be escalate please provide all the above updates)

404 Not Found

Possible Reasons

1. The input stream may be misconfigured

Debugging Steps

1. Check if the input stream has the correct Content ID from CMS.
2. Check input stream with ffprobe on respective server
3. Test playing input stream with VLC Player
4. Check if transcoder status is "Running"
 - a. If not running then restart the transcoder
5. Check if packager status is "Running"
 - a. If not running then restart the packager
6. Try restarting the transcoder and respective packager. (Disable and Enable resource to restart)
7. Escalate if not resolved.

(If it need to be escalate please provide all the above updates)

Input Stream is not working

Possible Reasons

1. Encoder might have some issues.

Debugging Steps

1. Please check the encoder.

(If it need to be escalate please provide all the above updates)

Streaming stucks after few seconds

The player would start playing the media for a few seconds but would stop after sometime within a minute.

Possible Reasons

1. Input stream might have been stopped.
2. Transcoder may not be running properly.
3. Packager may not be running properly.

Debugging Steps

1. Check input stream with ffprobe on respective server
2. Try restarting the transcoder and respective packager.
3. Escalate if still not fixed.

(If it need to be escalate please provide all the above updates)

No packages found to the Content

This appears in packager-hls and packager-dash. This DOES NOT appear in packager-aes.

Possible Reasons

1. Usually this error is displayed when the packager is not able to retrieve the encryption keys from CPIX API

Debugging Steps

1. Inform to Sunil sir and Bharat

(If it need to be escalate please provide all the above updates)

Audio not coming

Possible Reasons

1. Maybe no audio stream selected on packager

Debugging Steps

1. Check input stream with ffprobe on respective server
2. Check in vLive at the packager page. If at least one audio stream is enabled.
3. Select audio stream if not selected.

(If it need to be escalate please provide all the above updates)

Running with delay (Running from Catchup)

Possible Reasons

1. The transcoder may not be running properly.
2. The packager may not be running properly.

Debugging Steps

1. Compare AES stream with DASH/HLS stream. If the delay is more than 10 seconds.
2. Check if the application is showing a button 'Go Live', click this and see if the issue fix.
 - a. If the issue is fixed with 'Go Live', Mobile app team (Mobiotics) needs to resolve the issue on app.
3. Follow up with Mobile app Team (DishHome)

(If it need to be escalate please provide all the above updates)

Testing

AES

- AES can be tested on the following
 1. Browser
 2. VLC
 3. Set top boxes

DASH

- DASH can be tested on the following
 1. Browsers like Edge, Chrome. (Use Web App)
 2. Android phones. (Download App from Play Store)
 3. Android tablets app. (Download App from Play Store)

HLS

- HLS can be tested on the following
 1. Browser Safari (Use Web App)
 2. Apple phone app (iOS) (Download App from App Store)
 3. iPad phone app (iPadOS) (Download App from App Store)
 4. Macbooks
